# Sensors

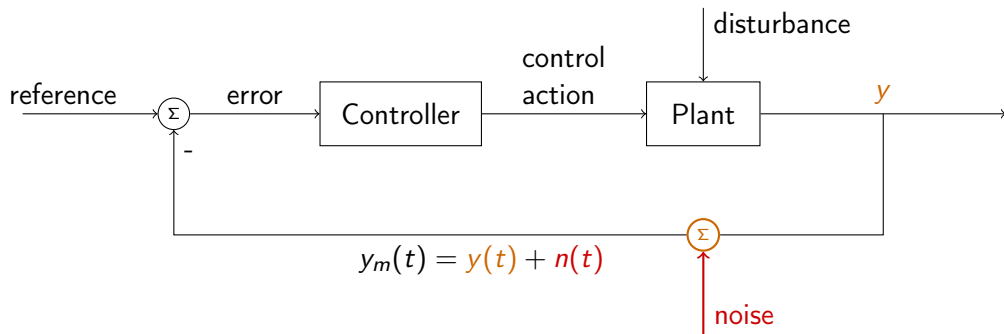

# Sensors

It is **inevitable** that sensors introduce **noise** into the system.

# Sensors

It is important to know the (statistical) characteristics of the measurement error!

# Sensors - characteristics

- ▶ **Accuracy** How correct is the measurement on average
- ▶ **Precision** How much do the errors vary (standard deviation)
- ▶ **Sensitivity/resolution** The smallest change in the measured variable that can be detected
- ▶ **Delay**  $y_m(t) = y(t - \tau) + n(t)$
- ▶ **Sampling and digitalization**

# Sensors - characteristics

# Incremental encoder

*Pulses Per Revolution (PPR)* is 4 in the example. Each aperture covers a sector of  $\frac{360^\circ}{2 \times PPR} = 45^\circ$ .

## Incremental encoder

**Activity** If both rising **and** falling edges of both signals **A** and **B**, what is the smallest change in angle that can be detected (*sensitivity* of the sensor)?

## Incremental encoder

**Activity** In the above example, does the encoder turn clockwise (CW) or counter-clockwise (CCW)?

## Incremental encoder - velocity

We want to find the angular velocity at the time-instant  $t = 6.5$  ms. For the encoder we have  $\text{PPR}=8$ , and both rising and falling edges of both signals A and B are counted, resulting in 32 counts per revolution.

**Activity** Calculate the angular velocity in rad/s for case (a) using a sampling period of  $\Delta t = 0.5$  ms, and for case (b) using a sampling period of  $\Delta t = 5$  ms.

## Incremental encoder - Velocity from frequency of the counts

The velocity can be measured by the inverse of the time between subsequent pulses. In the example there is an interval of 1 ms between the two pulses. The velocity becomes

$$\begin{aligned} v &= 1 \text{ pulses/ms} = \frac{1/32 \text{ revolutions}}{10^{-3} \text{ s}} \\ &= \frac{2\pi}{32} \times 1000 \text{ rad/s} = 196.3 \text{ rad/s} \end{aligned}$$

# Incremental encoder - Velocity from frequency of the counts

**Activity** Calculate the velocity at  $t = 11$  ms!

# Simulink exercise - decoder

Complete the simulink diagram so that the angular velocity is correctly estimated.
